CURRENT RESEARCH INTERESTS

Synthesis of new hierarchical wasteform materials for the effective immobilization of nuclear waste in persistent architectures

Crystal growth of new oxide materials

Crystal growth of new fluorides

Crystal growth of new chalcogenides

Synthesis of new, structurally complex, scintillator materials

Investigation of optical, electronic and magnetic properties of new materials

Cooperative structure-property relationships

We investigate the crystal growth of new materials, including new scintillating and luminescing oxides and fluorides, and new uranium and thorium containing structures. In the latter case, we synthesize new hierarchical wasteform materials for the effective immobilization of nuclear waste in persistent architectures.
